The present sequence is a novel human protein (NHP) which share structural similarity with animal Notch ligands, particularly SEL-1.

SEL-1 proteins are negative regulators of Notch family receptors.

Outch receptors and their associated signalling pathways have been associated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic Structure of a given locus/allele and designing diagnostic tests. The STRUCTURE of a given locus/allele and designing diagnostic tests. The STRUCTURE of a given locus/allele and designing diagnostic tests. The STRUCTURE of a given locus/allele and designing diagnostic tests. The STRUCTURE of a given locus/allele and designing diagnostic tests. The STRUCTURE of NHP in the body. Nucleotide constructs encoding functional NHPs, antisense molecules can be used in gene therapy approaches for modulating gene expression such as for preventing or treating Alzheimer's disease, diabetes, cancer (pancreatic cancer, insullanomas), blood pressure abnormalities, neurodegenerative diseases such as Parkinson's disease, stroke, vascular dementia and conditions requiring modulation of fat and cholesterol metabolism such as coronary
                                                                                                                             Novel isolated human polynucleotides encoding polypeptides sharing sequence similarity with mammalian SEL-1 proteins which are negative regulators of Notch family receptors, useful for treating diabetes,

The present sequence is a nover numer process.

Structural similarity with animal Notch ligands, particularly SEL-1.

SEL-1 proteins are negative regulators of Notch family receptors.

Notch receptors and their associated signalling pathways have been sesociated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic structure of a given locus/allele and designing diagnostic tests. The NHP is also useful in screening techniques for drugs which treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding functional NHPs, antisense, antisense molecules can be used in gene therapy approaches for modulating gene expression such as for preventing or treating Alzheimer's disease, diabetes, cancer (pencreatic cancer, insulinomas), blood pressure abnormalities, neurodegenerative diseases such as Parkinson's disease, stroke, vascular dementia and conditions requiring modulation of fat and cholesterol metabolism such as coronary
polymorphism; drug screening; Alzheimer's disease; diabetes; cancer; pancreatic cancer; insulinoma; blood pressure; neurodegenerative disease; Parkinson's disease; stroke; vascular dementia; fat metabolism; cholesterol metabolism; coronary artery disease; gene therapy; cerebroprotective.

Notch receptors and their associated signalling pathways have been associated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic structure of a given locus/allele and designing diagnostic tests. The NHP is also useful in screening techniques for drugs which treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding functional NHPs, antisense molecules can be used in gene therapy approaches for modulating gene expression such as for preventing or treating Alzheimer's disease, diabetes, cancer (pancreatic cancer, insulinomas), blood pressure abnormalities, neurodegenerative diseases such as Parkinson's disease, stroke, vascular dementia and conditions requiring modulation of fat and cholesterol metabolism such as coronary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
The present sequence is a novel human protein (NHP) which share structural similarity with animal Notch ligands, particularly SEL-1. SEL-1 proteins are negative regulators of Notch family receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    INKRENLLEKKKNORKIRIKGIONKDILKRNKNHLOKQAEKNFTDEGDQLFKMGIKVLQQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a novel human protein (NHP) which share structural similarity with animal Notch ligands, particularly SEL-1. SEL-1 proteins are negative regulators of Notch family receptors. Notch receptors and their associated signalling pathways have been associated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic structure of a given locus/allele and designing diagnostic tests. The NHP is also useful in screening techniques for drugs which treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated human polynucleotides encoding polypeptides sharing sequence similarity with mammalian SEL-1 proteins which are negative regulators of Notch family receptors, useful for treating diabetes,
                                                                                                                                                                                                                                                                                                    Novel human protein (NHP) #7, sharing similarity with Notch ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NHPs, antisense, antisense molecules can be used in gene therapy

NHPS, antisense, antisense molecules can be used in gene therapy approaches for modulating gene expression such as for preventing or treating Alzheimer's disease, diabetes, cancer (pancreatic cancer, insulinomas), blood pressure abnormalities, neurodegenerative diseases such as Parkinson's disease, stroke, vascular dementia and conditions requiring modulation of fat and cholesterol metabolism such as coronary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a novel human protein (NHP) which share structural similarity with animal Notch ligands, particularly SEL-1. SEL-1 proteins are negative regulators of Notch family receptors. Notch receptors and their associated signalling pathways have been associated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic structure of a given locus/allele and designing diagnostic tests. The NHP is also useful in screening techniques for drugs which treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. SEL-1 proteins are negative regulators of Notch family receptors. Notch receptors and their associated signalling pathways have been associated with development, apoptosis, neuron growth and maintenance. Labeled NHP probes can be used to screen a human genomic library which is helpful for identifying polymorphisms, determining the genomic structure of a given locus/Allele and designing diagnostic tests. NHP is also useful in screening techniques for drugs which treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleocitde constructs encoding functional NHPs, antisense, antisense molecules can be used in gene therapy

The present sequence represents the protein from a gene designated TSA305, which is expressed specifically in pancreas tissue. The gene, sequences hybridizing with it, its expression product, and antibodies recognizing the expression product, are useful in the investigation, diagnosis, prevention and treatment of pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           515

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nocitropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; cosquiant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatorio, to, preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The proteins and nucleic acids may be used to treat cancers; proliferative disorders, neurodegenerative disorders, osteoarthritis, colliferative disorders, neurodegenerative disorders, osteoarthritis, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal heemoglobinuria, antilifammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

= ---

```
This sequence is a Sel-1L (Sel-1 like) protein (also previously known as Hip-1) of the invention. A vector containing the Sel-1L DNA, and the host cell containing it can be used to prepare a Sel-1L protein. Compositions containing the Sel-1L proteins, or peptides that interfere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sel-1L, Sel-1 like protein, Hip-1, Alzheimer's disease; diabetes; cancer; insulin dependent diabetes mellitus; pancreatic cancer; stroke; therapy; vascular dementia; Parkinson's disease; coronary heart disease;
                                                                                                                                                                                                                                                                                                                                                                                                                    515

```
This sequence is a Sel-1L (Sel-1 like) protein (also previously known as Hip-1) of the invention. A vector containing the Sel-1L DNA, and the host cell containing it can be used to prepare a Sel-1L protein. Compositions containing the Sel-1L proteins, or peptides that interfere with their binding can be used in a method for treating or preventing Alzheimer's disease, diabetes (especially insulin dependent diabetes mellitus), cancer (especially pancreatic cancer), stroke, vascular dementia, Parkinson's disease, or coronary heart disease. The compositions can also be used to treat conditions requiring modulation of fat or cholesterol metabolism.

A vector containing the Sel-IL DNA, and the host cell containing it can be used to prepare a Sel-IL protein. Compositions containing the Sel-IL proteins, or peptides that interfere with their binding can be used in a method for treating or preventing

                                                                                                                                                                                                                                                                                                                                ë,
                                                                                                                                                                           This sequence is a Sel-1L (Sel-1 like) protein (also previously known as Hip-1) of the invention. A vector containing the Sel-1L DNA, and the lost cell containing it can be used to prepare a Sel-1L protein. Compositions containing the Sel-1L proteins, or peptides that interfere with their binding can be used in a method for treating or preventing Alzheimer's disease, diabetes (especially insulin dependent diabetes mellitus), cancer (especially pancreatic cancer), stroke, vascular compositions can also be used to treat conditions requiring modulation of fat or cholesterol metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                          495

The invention relates to 40 human secreted proteins (AAY94981-Y95020),
and cDNA sequences encoding them (AAA23423-A23462). The secreted
proteins of the invention include those that are thought to be only
partially secreted, i.e., transmembrane proteins. The proteins of the
invention may exhibit one or more activities selected from the following:
cytokine activity; cell profileration; differentiation; immune
modulation; haematopoiesis regulation; differentiation; immune
modulation; haematopoiesis regulation; tissue growth activity;
activin/inhibin activity; anti-inflammatory activity; and tumnor
inhibition activity. The proteins may be administered to patients as
vaccines, and the nucleotides may be used as part of a gene therapy
regime. Diseases or conditions that may be treated using the proteins or
uncleotides of the invention include autoimmune diseases; genetic
disorders; haemophilia; cardiovascular diseases; cancer; bacterial,
fungal and viral infections, especially HIV; multiple sclerosis;
rheumatoid arthritis; pulmonary inflammation; dullabn-Barre syndrome;
insulin dependent diabetes mellitus; and allerdic reactions such as
asthma and anaemia. They may also be used for treating wounds, burns,
ulcers, osteoporosis; osteoarthritis, periodonal diseases, Alzhelmer's
clateral sclerosis (ALS). Proteins with activin/finhibin activity may
activity may be useful as contraceptives. Nucleic acid sequences of the

                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-prager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activity, inhibin activity, chemicatic/chemokinetic activity, heamostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 22,
